

Microsoft survey on enterprise social use and perceptions

The ways in which people connect and the speed with which they communicate is faster than ever before. Social communication is nothing new on the personal level, with the sharing of news, images and status updates. It's how people keep up with each other's lives.

On the enterprise level, businesses have to be agile to keep up with the competition. And since communicating and sharing information with people is fundamental to the success of any business, many enterprises are taking measures to employ tools that can provide that extra edge.

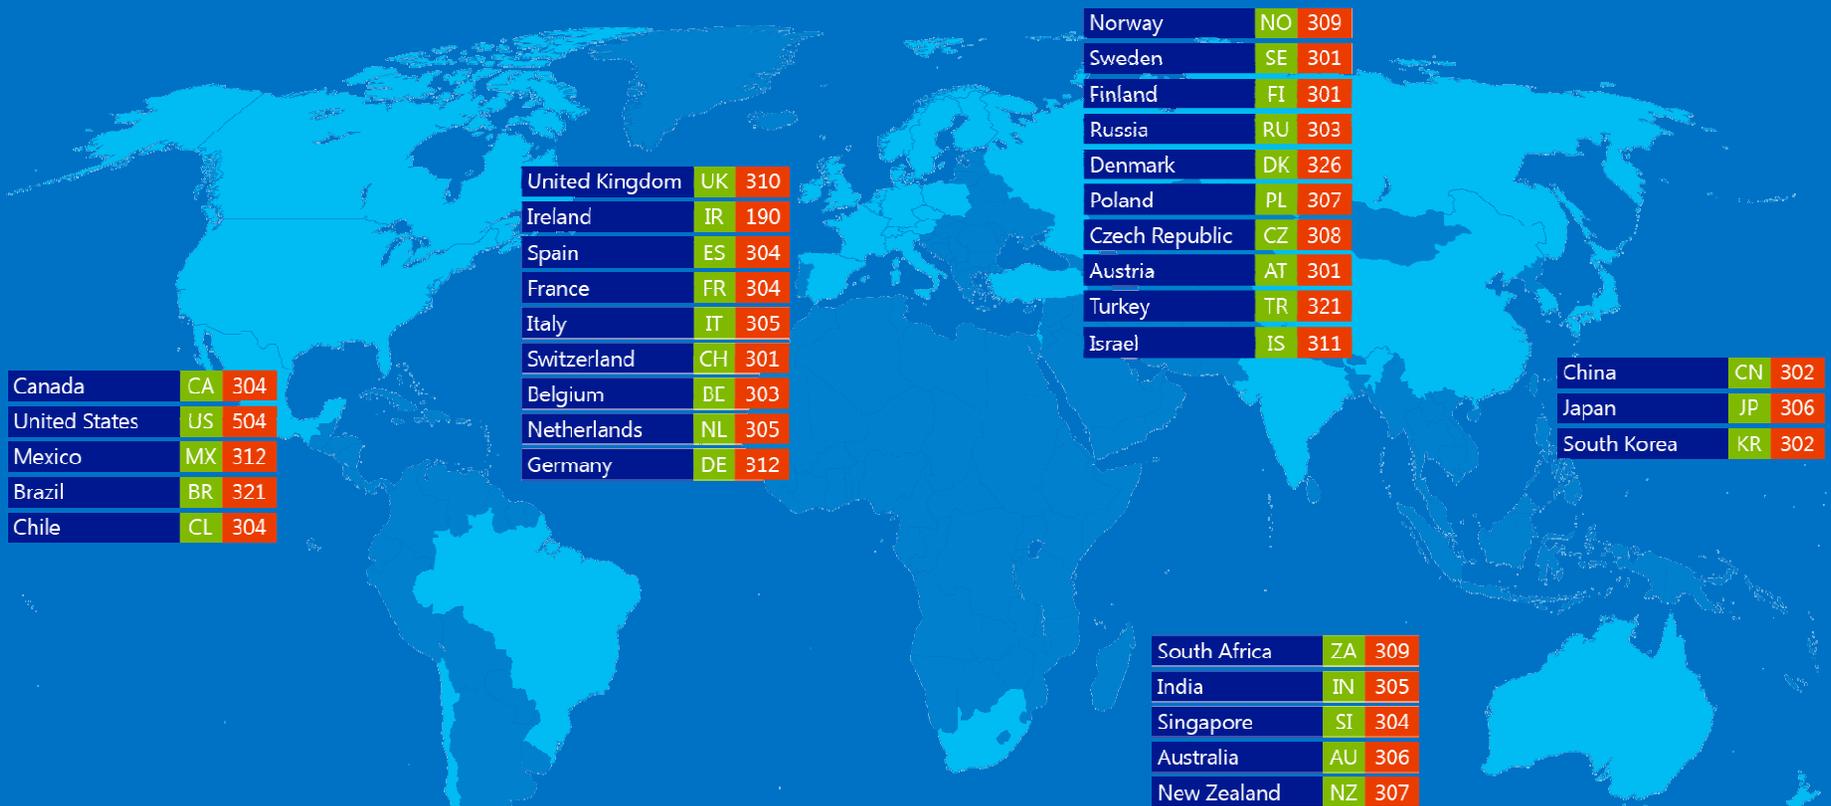

Microsoft wanted to find out more about the uses — or lack of use — of social tools in business. What social tools were most common, what tools were restricted and how far would people go to get their hands on those tools?

These are just a few of the questions Microsoft asked in a major global survey — and the results from nearly 10,000 respondents may surprise you.

Microsoft survey: by the numbers

The following are findings of a global survey of information workers, defined as employed adults working at a company with at least 100 employees who use a personal computer, laptop, tablet or smartphone for at least 75 percent of their job function. The survey was conducted online March 25, 2013 through April 24, 2013. A total of 9,908 individuals were surveyed across 32 countries.

The following table lists the countries surveyed, the number of respondents in each and the country abbreviations used in these results.

Reasons for restrictions: by country

Productivity loss was seen as the No. 1 reason given by workers in nine countries for restrictions placed against them in the office, including Belgium, Brazil, Chile, the Czech Republic, Italy, Mexico, Poland, South Africa and Spain. Security concerns were cited by the remaining 23 countries as their top reason for restricting social tools.

Impact on productivity: by country

Increased productivity by usage of social tools is most prevalent in China, followed by India, Turkey, Mexico and Russia. These are also the countries where use of these tools is most common.

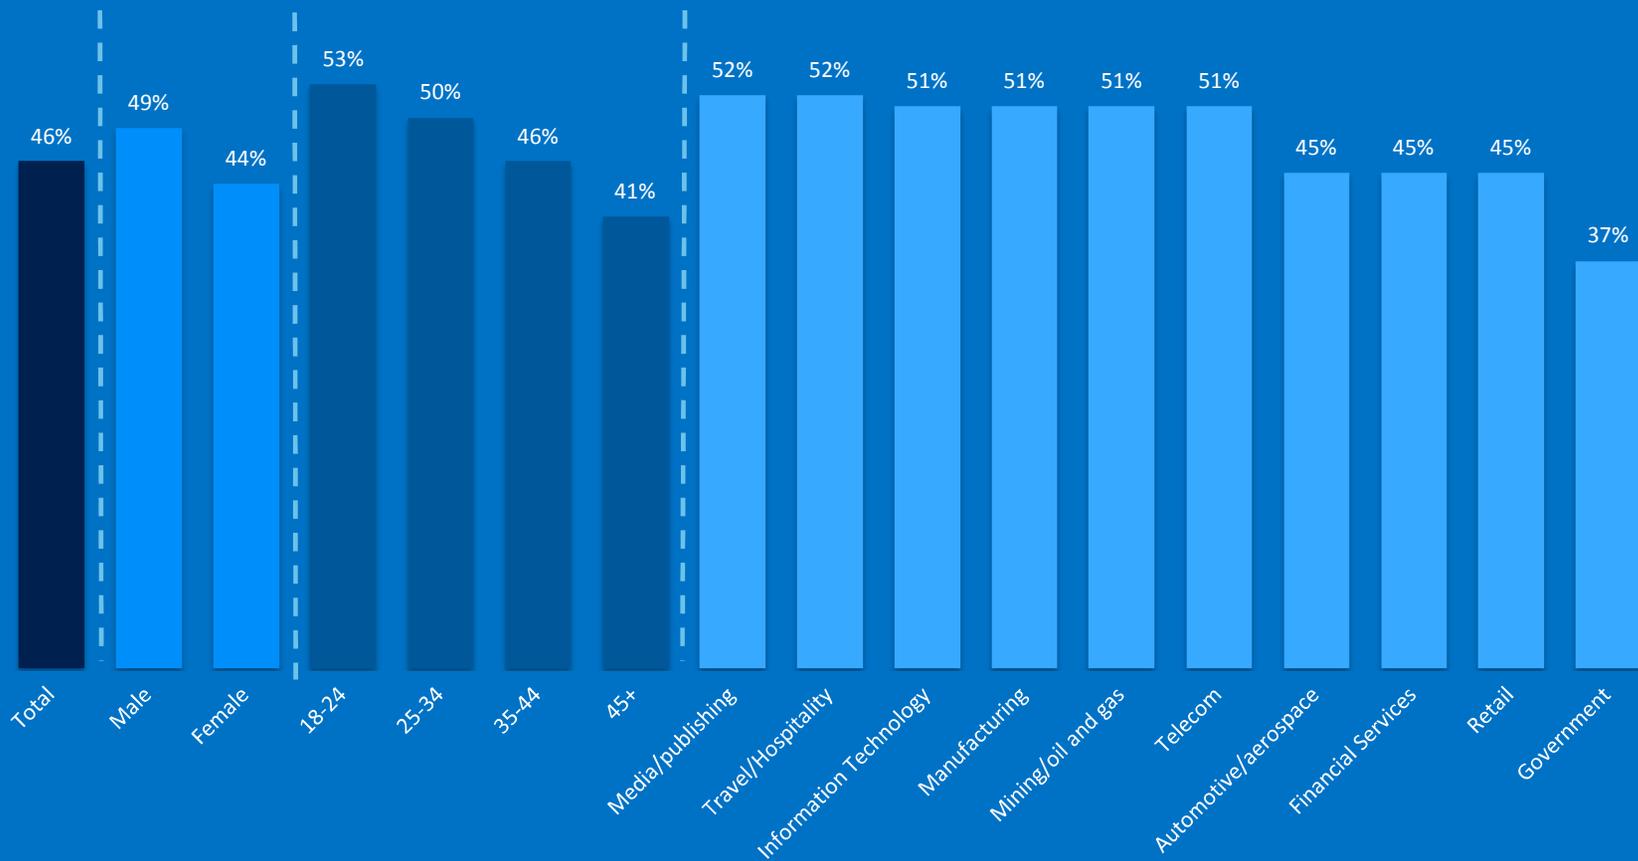

Productivity Greatly/Somewhat Increased

Impact on productivity: demographics

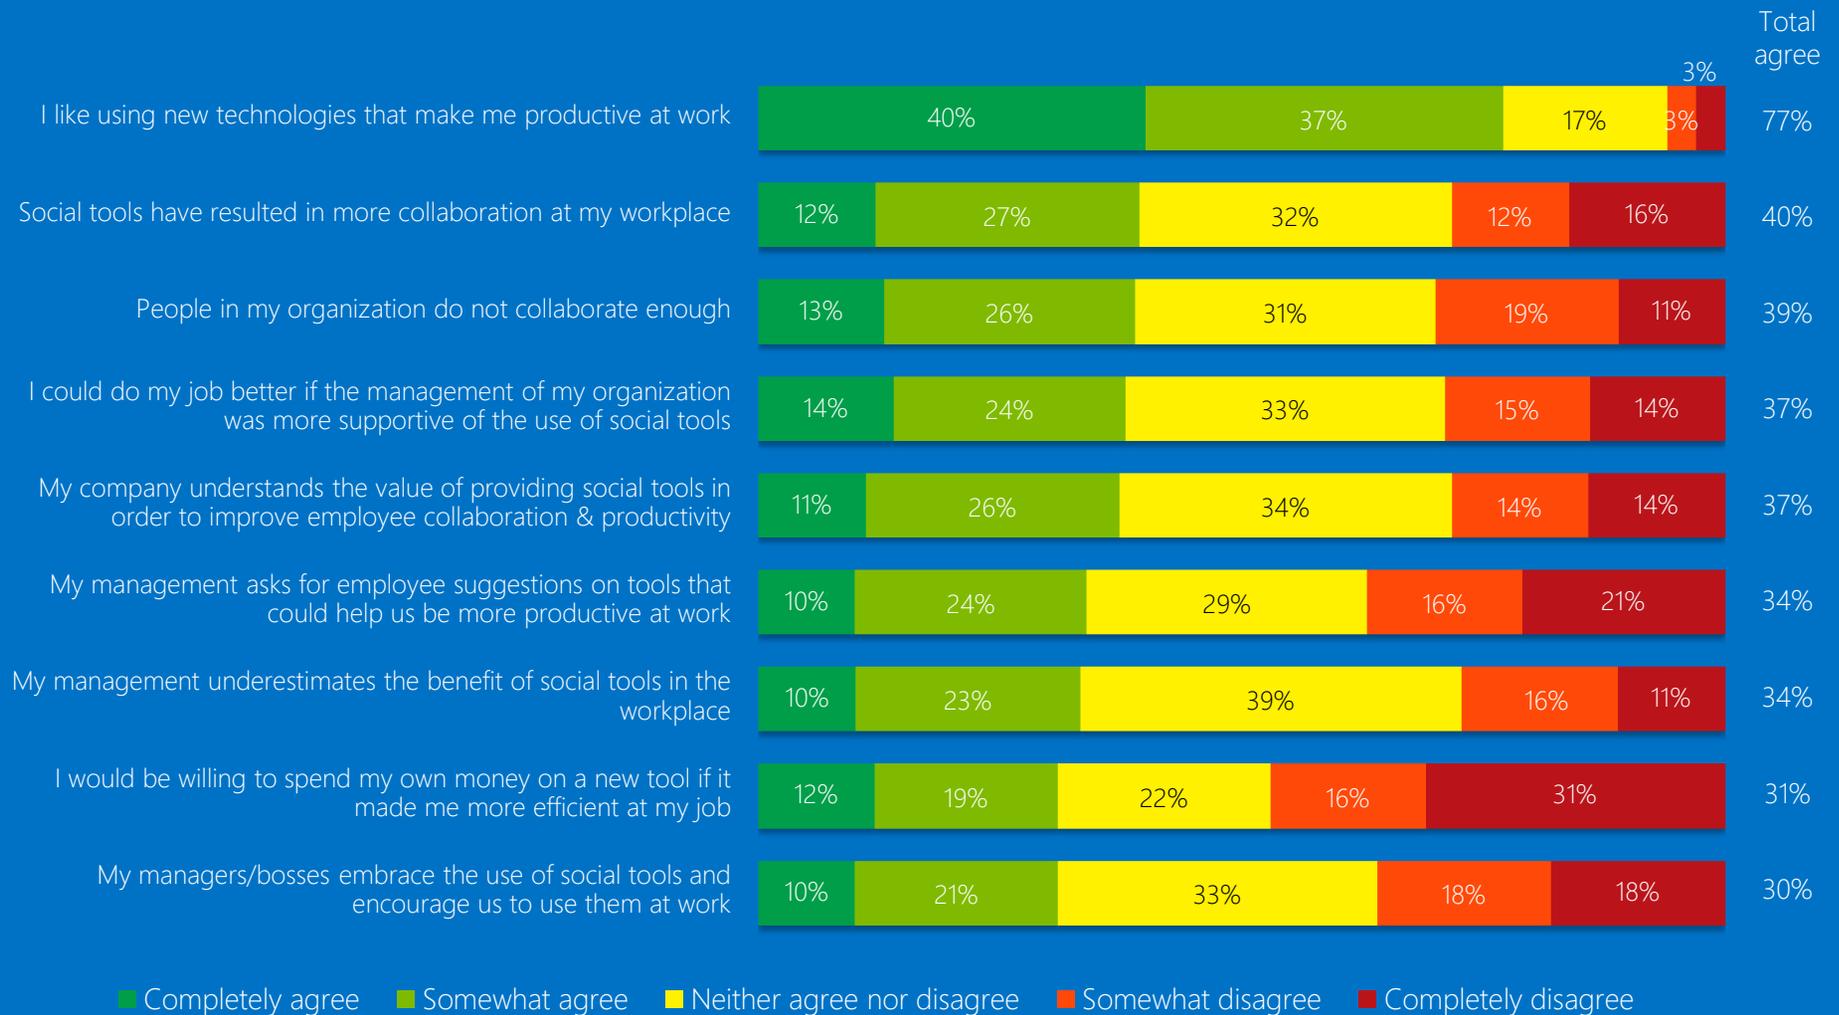

Across sectors, those in travel and hospitality; media and publishing; IT; mining, oil and gas; telecom; and manufacturing are most likely to say they are more productive thanks to social tools. Those in government are the least likely.

Productivity Greatly/Somewhat Increased

Recognizing the value of social tools

About three in 10 respondents said they would spend their own money on social tools in the workplace if it made them more productive. Yet many employers do not seem to recognize the value of social tools; just 30 percent of respondents feel their managers embrace social tools, and more than one-third feel their company underestimates the benefits of these tools.

Recognizing the value of social tools: demographics

Although there are not many notable differences across gender, men are more likely than women to say that they would be willing to spend their own money on a social tool that would make them more efficient at their job.

	Total	GENDER		AGE			
		Male	Female	18-24	25-34	35-44	45+
I like using new technologies that make me productive at work.	77%	76%	78%	78%	79%	78%	74%

Learning about and adopting social tools

While a majority of respondents rely on their IT departments to show them new technologies that would make their job easier, nearly as many say they count on their colleagues to do so.

Access to social tools

Though about six out of 10 respondents say that they have full access to the technology and tools they need to do the best job they can, 40 percent indicate that their IT departments can be a barrier to their access.
